DUNIA ALERTS IN ONE MINUTE

Helping schools act before bad air, extreme heat, heavy rain or floods arrive.

Dunia Alerts watches for four dangers around schools in Nairobi. When one is coming, our team tells the head teacher what to do, and parents get a message. Every step is written down, so we learn what keeps children safe.

FOUR DANGERS WE WATCH

- Dirty air
- Extreme heat
- Heavy rain
- Rising rivers

From data to action, in six steps

Steps 1 and 2 are automatic. A person always does step 3.

1 Watch
Every 15 minutes, it reads free forecasts of weather, air and rivers for each school's exact spot.

2 Spot it early
If a number crosses its safe line (see below), now or in the next 48 hours, it raises a flag.

3 A person decides
Someone on the Dunia team checks every flag. A computer never sends a warning on its own.

4 Tell
The head teacher gets a short WhatsApp or SMS with one clear step. Parents hear in English and Kiswahili.

5 Act
The school does the step: games indoors, water breaks, or a safe early release.

6 Record and learn
The time of each step is saved, so we see what worked. A child's name is never written.

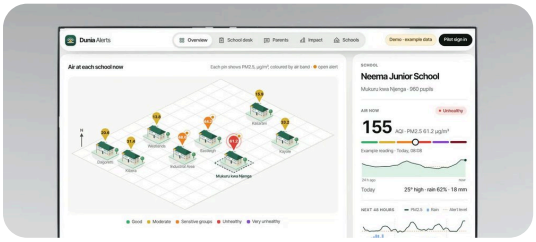

The four safe lines

When a number crosses its line, the dashboard raises a flag.

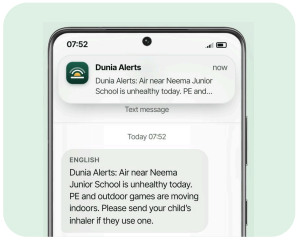

DANGER	WE WARN WHEN	WHAT THE SCHOOL DOES	NUMBERS COME FROM
Dirty air	Dust in the air (PM2.5) reaches **35.5 µg/m³** or more	PE moves indoors. Children with asthma stay inside.	Copernicus forecasts and AirQo air sensors
Extreme heat	The day's high will be **30 °C** or more	Water breaks, shade, and PE early in the day.	Open-Meteo forecasts
Heavy rain	**30 mm** of rain or more in one day	Keep away from drains. Plan a safe early release.	Open-Meteo and Kenya Met Department
Rising river	A nearby river runs at **twice** its usual flow	Check the routes home. Plan the release.	Global Flood Awareness System

Three screens, three jobs

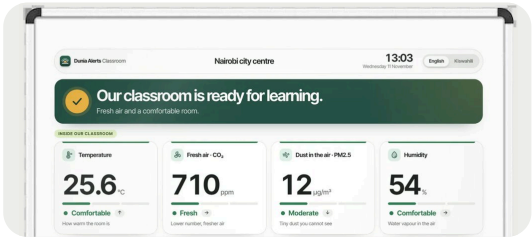

Pictures show the demo: made-up schools and example data.

The dashboard · Dunia team
A map of the schools, flags to check, and a record of every alert.

The message · parents
Two languages. Any phone.

The classroom screen · learners
The room's fresh air, heat, dust and humidity, and a Climate Detective question each day.

WHY WE KEEP A RECORD

From classroom numbers to better schools, and better decisions

Alerts help today. The record helps tomorrow. This is how what we learn in one classroom can grow into better choices for many schools.

CLASSROOM

See it

The screen and the record show when a room gets too hot, stuffy or dusty.

SCHOOL

Try a fix

Shade, better airflow, PE earlier, water breaks. Did the room get better?

INDEPENDENT EVALUATOR

Check it

An outside expert checks class-level numbers and costs, so results can be trusted.

COUNTY AND NATIONAL OFFICES

Decide

Education and environment offices see what works and what it costs, and spread good fixes.

What the pilot will collect

- Room readings: heat, humidity, fresh air (CO_2) and dust (PM2.5)
- Whole-class attendance and lessons interrupted, approved by the school
- Short surveys teachers choose to answer, and what each fix cost
- When each alert was sent, answered and acted on

What we never collect

- ✕ Children's names
- ✕ Pictures, video or sound (no camera, no microphone)
- ✕ Anything about one child, or small groups in public reports

Where we are, and the long-term plan

Everything after "Now" is planned. There are no pilot results yet.

NOW · NOV 2026

Built and live

The dashboard runs on live data. The demo and classroom screen are open to all. The first pilot schools are being added.

NEXT

Classroom sensors

Indoor and outdoor sensors, a box that keeps readings when the internet drops, and a wall screen.

THEN · TWO SCHOOL TERMS

Two-classroom study

Two similar classrooms: measure both for 4 to 6 weeks, then one gets shade and better airflow. **It shows what is practical, not national proof.**

PLANNED

Children's voice

Classes share what they notice and worry about, and get answers from decision-makers.

AFTER THE STUDY

Share the evidence

Checked, class-level summaries go to county and national offices, and to funders.

LATER

More schools and cities

The forecasts cover the whole world, so other cities could use the same approach.

PM2.5
Tiny dust and smoke that gets deep into our lungs.

CO_2
The gas we breathe out. Lots of it means the room needs fresh air.

Forecast
What scientists expect the weather, air or river to do next.

Baseline
Measuring first, before changing anything, to compare later.

Evaluator
An outside expert who checks the results fairly.

Scan to see how it works

Try it. Share it. Support it.
